## MODULE 3 : CENTROID

### Centroid:

Centroid is the point at which total area assumed to be concentrated.

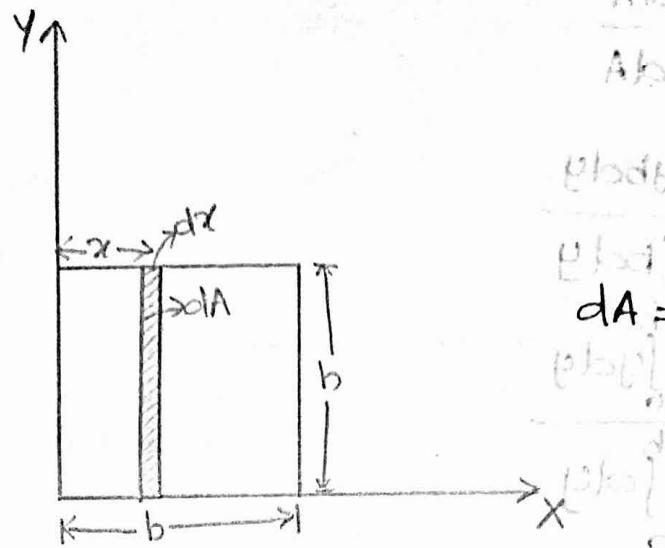

### Centre of gravity:

Centre of gravity is the point at which the total weight is assumed to be concentrated.

### Centroid of a Rectangle

To find  $\bar{x}$ : Consider a vertical strip of thickness  $dx$  at a distance  $x$  from the Y axis.

$$A_{\text{tot}} = \bar{x}$$

$$A_{\text{tot}}$$

~~product~~

~~product~~

$$dA = hdx$$

~~product~~

~~product~~

~~product~~

$$\bar{x} = \frac{\int x dA}{\int dA}$$

$$\frac{d}{dx} = \frac{d}{dx} =$$

$$\left( \frac{d}{dx} \right) = \frac{\int x h dx}{\int h dx}$$

$$= \frac{\int_0^b x dx}{\int_0^b dx}$$

$$= \frac{\left[ \frac{x^2}{2} \right]_0^b}{[x]_0^b} = \frac{b^2}{2b}$$

$$\bar{x} = \frac{b}{2}$$

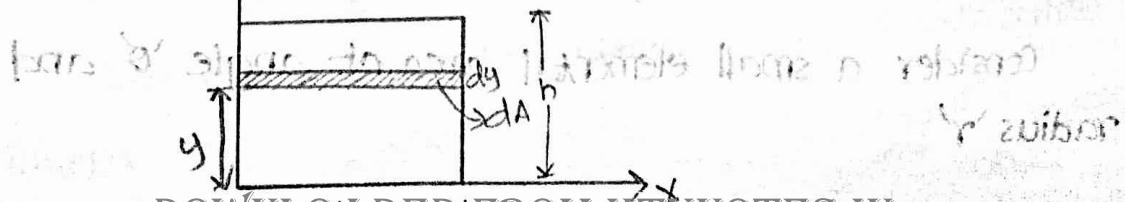

$$A_{\text{tot}} = \bar{x}$$

$$A_{\text{tot}}$$

To find  $\bar{y}$ : Consider a horizontal strip of thickness  $dy$  at a distance  $y$  from the  $x$ -axis.

$y$

$$dA = bdy$$

$$\bar{y} = \frac{\int y dA}{\int dA}$$

$$= \frac{\int y b dy}{\int b dy}$$

$$= \frac{\int_0^b y dy}{\int_0^b dy}$$

$$= \frac{b^2}{2 \times b} = \frac{b}{2}$$

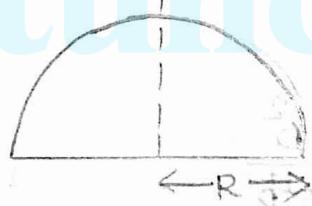

$$\frac{A_{left}}{A_{right}} = \bar{x}$$

$$A_{left}$$

$$\therefore \text{Centroid of a rectangle } (\bar{x}, \bar{y}) = \left( \frac{b}{2}, \frac{h}{2} \right)$$

Q: Locate the centroid of semicircle of radius  $R$ .

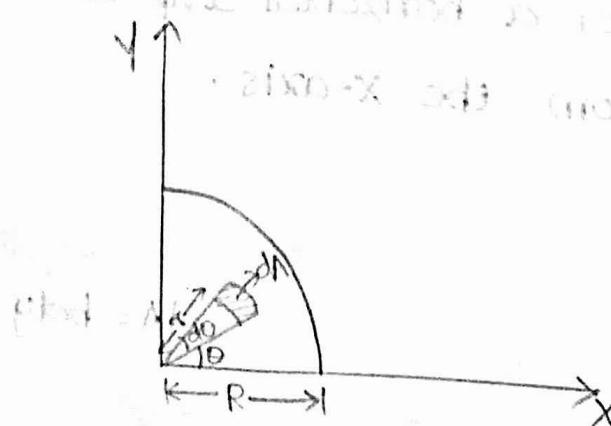

[Ktunotes.in](http://Ktunotes.in)

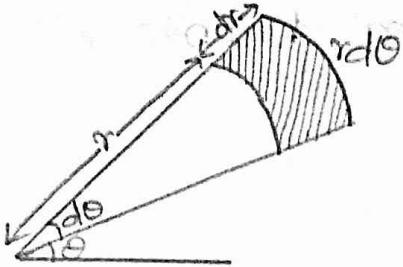

$$\bar{y} = \frac{\int y dA}{\int dA}$$

$$d = R$$

Consider a quadrant of a circle.

Consider a small elemental area at angle  $\theta$  and radius  $r$ .

Since the element is small, we can consider it as a rectangular area.

$$\therefore dA = r d\theta \cdot dr$$

$$x = r \cos \theta$$

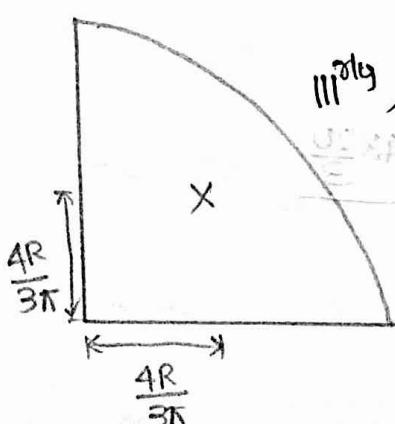

$$y = r \sin \theta$$

$$\bar{x} = \frac{\int_{r=0}^R \int_{\theta=0}^{\pi/2} r \cos \theta \cdot r d\theta dr}{\int_{r=0}^R \int_{\theta=0}^{\pi/2} r d\theta dr}$$

$$\bar{x} = \left[ \frac{r^3}{3} \right]_0^R \left[ \sin \theta \right]_0^{\pi/2}$$

$$\left[ \frac{r^2}{2} \right]_0^R \left[ \theta \right]_0^{\pi/2}$$

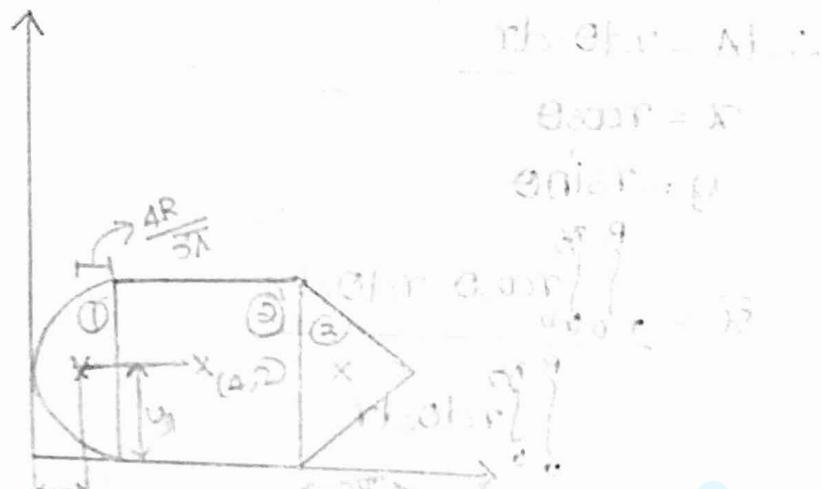

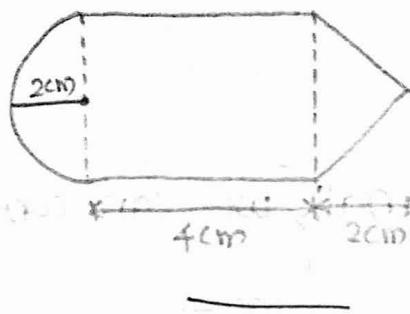

$$\bar{x} = \frac{\frac{R^3}{3} \times 1}{\frac{R^2 \times \pi}{2}} = \frac{R^3}{3} \times \frac{4}{R^2 \pi} = \frac{4R}{3\pi}$$

$$\bar{y} = \frac{4RA}{3\pi}$$

Thus, the distance of centroid of a semicircular lamina from its base is  $\frac{4R}{3\pi}$ .

Q: Locate the centroid of area shown.

$$x_1 = r - \frac{4r}{3\pi} \quad y_1 = 0 \quad A_1 = \frac{\pi r^2}{2}$$

$$x_2 = 4 \quad y_2 = 0 \quad A_2 = 4^2 = 16$$

$$x_3 = 6 + \frac{1}{3} \times 2, \quad y_3 = \frac{4}{2} = 2 \quad A_3 = \frac{1}{2} \times 4 \times 2 = 4$$

$$\bar{x} = \frac{A_1 x_1 + A_2 x_2 + A_3 x_3}{A_1 + A_2 + A_3}$$

$$= \frac{2\pi \times 1.151 + 16 \times 4 + 4 \times \frac{20}{3}}{2\pi + 16 + 4}$$

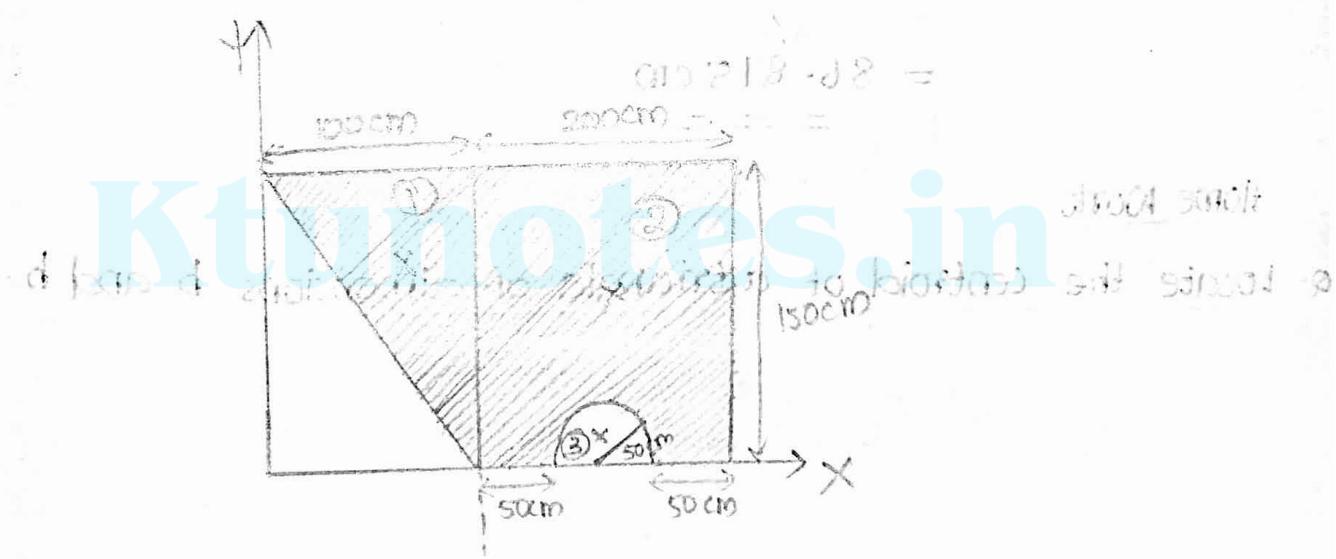

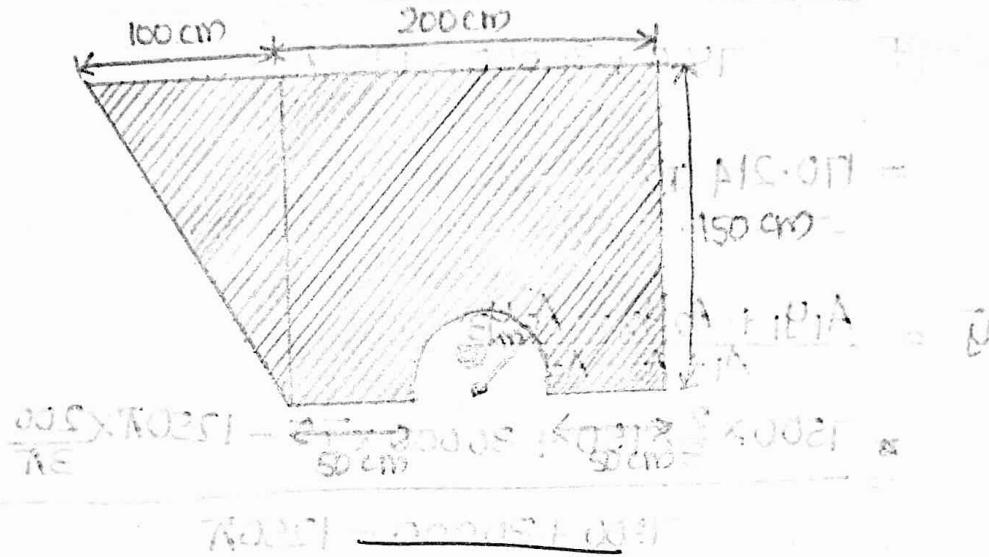

$$= \underline{\underline{3.725 \text{ cm}}}$$

$$\bar{y} = \frac{A_1 y_1 + A_2 y_2 + A_3 y_3}{A_1 + A_2 + A_3}$$

$$= \frac{2\pi \times 2 + 16 \times 2 + 4 \times 2}{2\pi + 16 + 4} = \underline{\underline{2 \text{ cm}}}$$

$$\text{centroid, } (\bar{x}, \bar{y}) = (3.725, 2)$$

Q: Locate the centroid of area shown.

$$A_1 = \frac{1}{2}bh = \frac{1}{2} \times 100 \times 150 = 7500 \text{ cm}^2$$

$$A_2 = 200 \times 150 = 30000 \text{ cm}^2$$

$$A_3 = \pi \times \frac{50^2}{2} = \frac{2500\pi}{2} = 1250\pi \text{ cm}^2$$

$$x_1 = \frac{2}{3} \times 100 \text{ cm} \quad y_1 = \frac{2}{3} \times 150 \text{ cm}$$

$$x_2 = 100 + 100 = 200 \text{ cm} \quad y_2 = \frac{150}{2} = 75 \text{ cm}$$

$$x_3 = 100 + 100 = 200 \text{ cm} \quad y_3 = \frac{4 \times 50}{3\pi} \text{ cm}$$

$$\bar{x} = \frac{A_1x_1 + A_2x_2 - A_3x_3}{A_1 + A_2 - A_3}$$

$$= \frac{7500 \times \frac{2}{3} \times 100 + 30000 \times 200 - 1250\pi \times 200}{7500 + 30000 - 1250\pi}$$

$$= 170.214 \text{ cm}$$

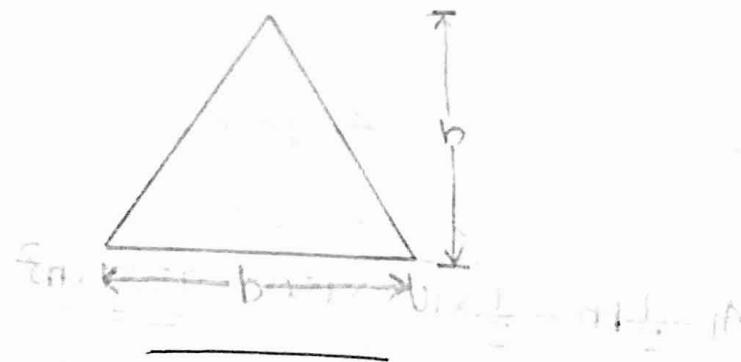

$$\bar{y} = \frac{A_1y_1 + A_2y_2 - A_3y_3}{A_1 + A_2 - A_3}$$

$$= \frac{7500 \times \frac{2}{3} \times 150 + 30000 \times 75 - 1250\pi \times \frac{200}{3\pi}}{7500 + 30000 - 1250\pi}$$

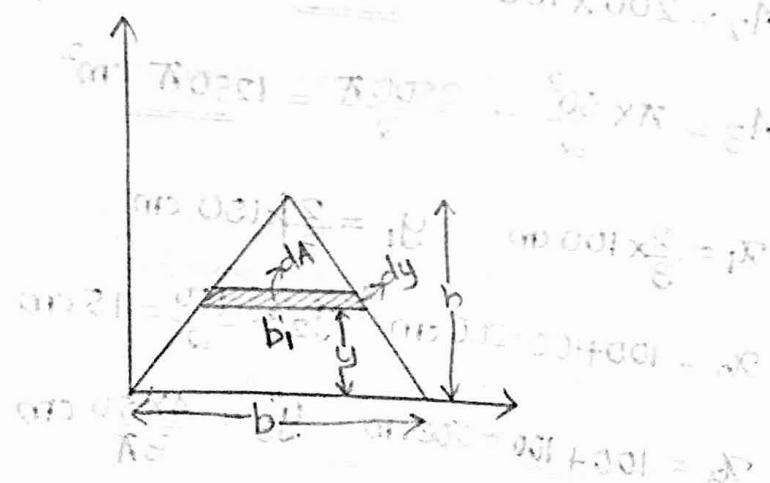

$$= 86.875 \text{ cm}$$

Home Work

- Q: Locate the centroid of a triangle of dimensions  $b$  and  $b$ .

To find  $\bar{y}$ :

Consider an elemental strip of thickness  $dy$  at a distance  $y$  from  $x$ -axis of width  $b$ .

$dA = b_1 dy$

Using the property of triangles,

$$\frac{b - b_1 y}{h} = \frac{b_1}{b}$$

$$b_1 = \frac{b(h-y)}{h}$$

$$dA = \frac{b}{h}(h-y)dy$$

$$\bar{y} = \frac{\int y dA}{\int dA} = \frac{\int_0^h y \frac{b}{h}(h-y)dy}{\int_0^h \frac{b}{h}(h-y)dy}$$

$$\int (hy - y^2)dy$$

$$= \left[ \frac{hy^2}{2} - \frac{y^3}{3} \right]_0^h$$

$$= \frac{\left[ hy^2 - \frac{y^3}{3} \right]_0^h}{\left[ hy - \frac{y^2}{2} \right]_0^h}$$

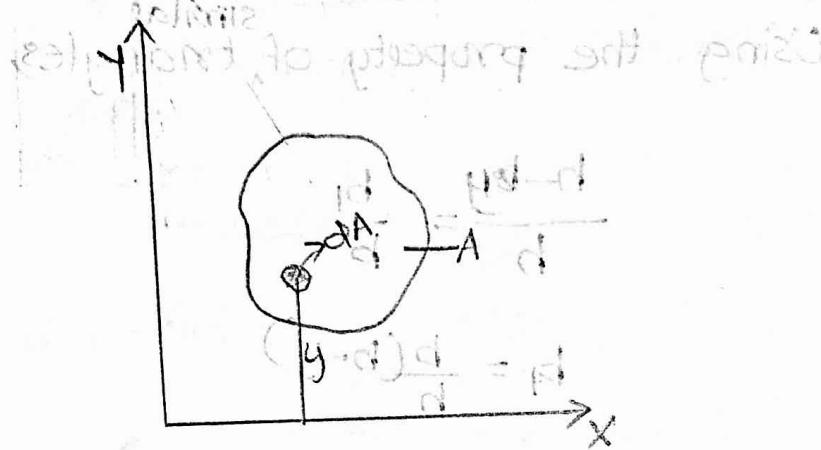

$$= \frac{\frac{h^3}{2} - \frac{h^3}{3}}{\frac{h^2}{2}}$$

$$= h \left( \frac{1}{6} \right)$$

$$\bar{y} = \underline{\underline{\frac{h}{3}}}$$

## MOMENT OF INERTIA

Moment of inertia is defined as the second moment of area about the axis.

$$I = y(ydA) \frac{d}{d}$$

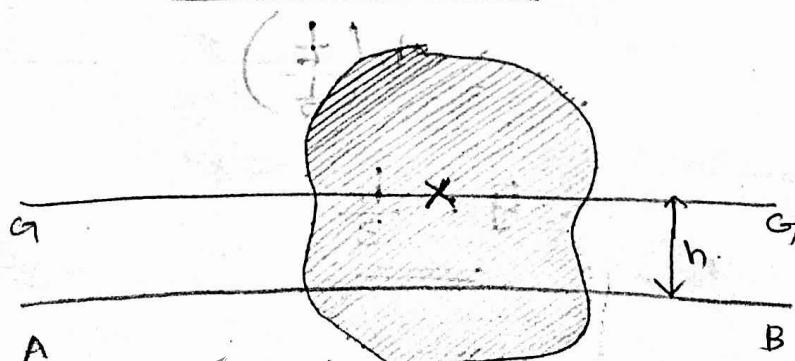

$$\frac{\rho b(p-d)y^2dA}{\rho b(p-d)} = \frac{Ab^2}{Ab} = \bar{b}$$

## PARALLEL AXIS THEOREM

It states that if inertia about the cent

It states that if  $I_G$  is the moment of inertia of a plane lamina of area 'A' about its centroidal axis in the plane of the lamina, then, the moment of inertia about any axis AB which is parallel to the centroidal axis and at a distance 'b' from the centroidal axis is given by

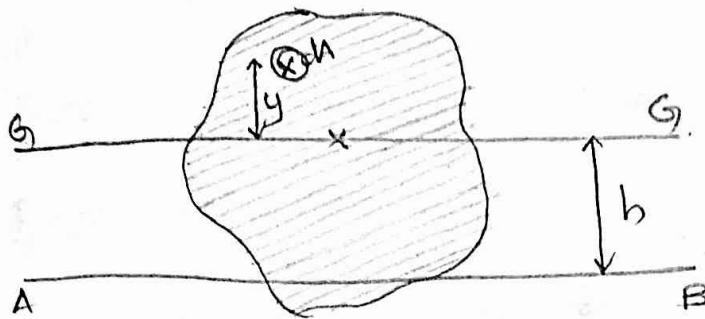

$$I_{AB} = I_G + Ab^2$$

A - Area.

Proof:

Solid A is to AB, more moments about a horizontal axis.

Consider an elemental area  $dA$  at a distance 'y' from centroidal axis. Then, moment of area about AB is  $(h+y)dA$  and second moment of area about AB is

$$\begin{aligned}
 I_{AB} &= \int (h+y)^2 dA \\
 &= \int (h^2 + y^2 + 2hy) dA \\
 &= \int h^2 dA + \int y^2 dA + \int 2hy dA \\
 &= h^2 \int dA + \int y^2 dA + 2h \int y dA \\
 &= h^2 A + I_G + 0
 \end{aligned}$$

$$I_{AB} = I_G + Ah^2$$

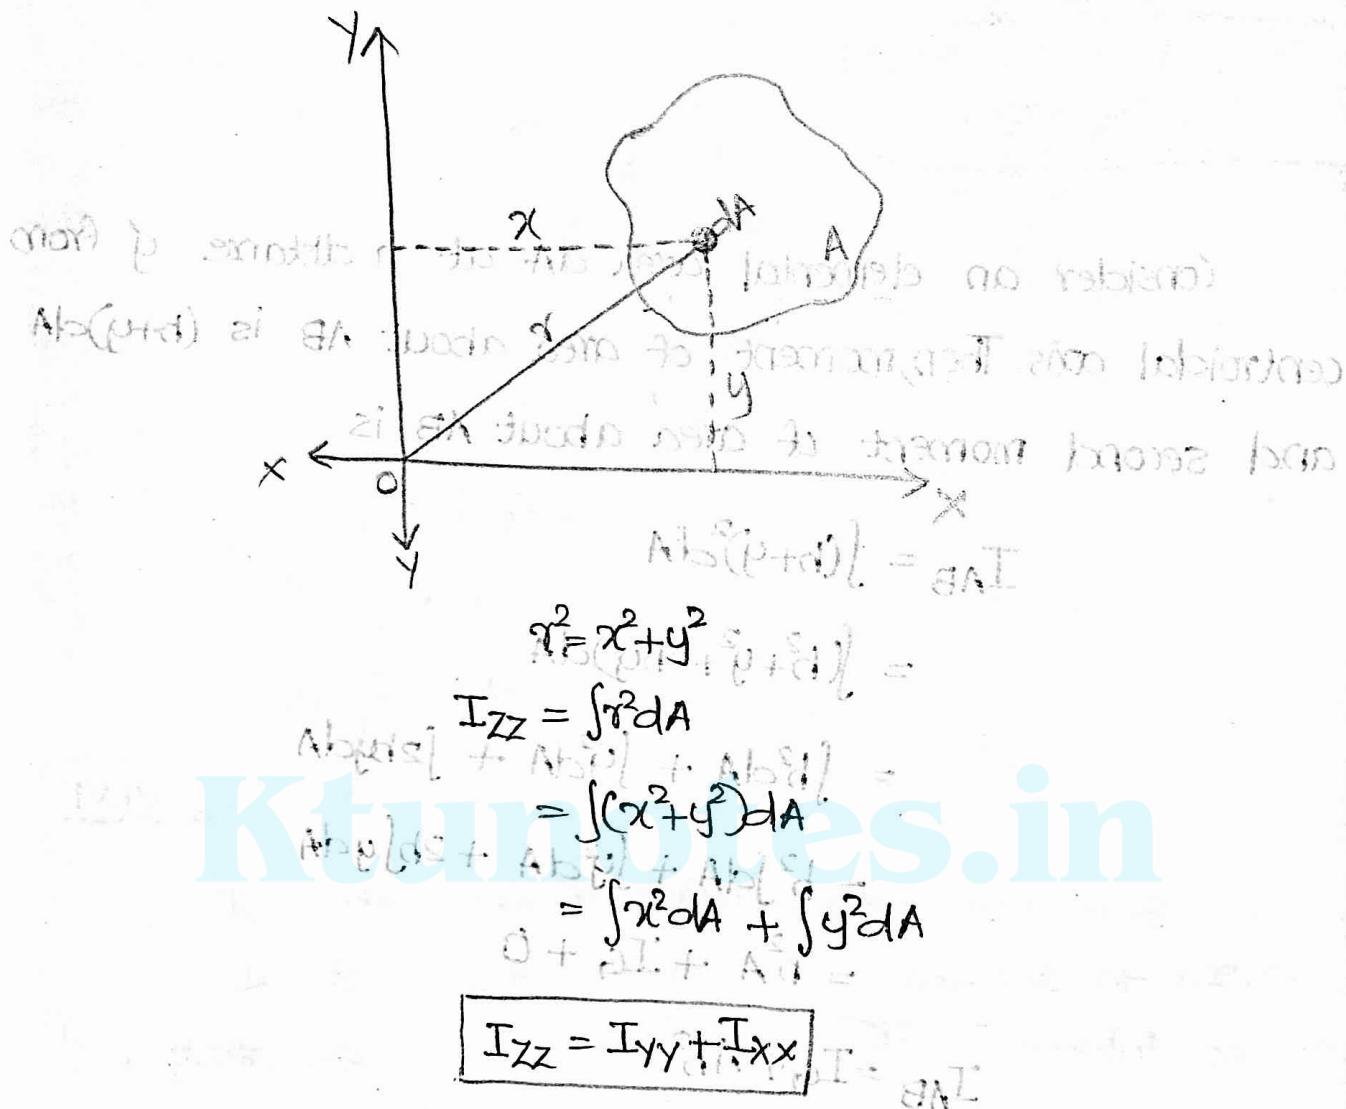

### PERPENDICULAR AXIS THEOREM

If  $I_{xx}$  and  $I_{yy}$  are moment of inertia of an area 'A' about mutually perpendicular axes  $xx$  and  $yy$  in the plane of the area, then moment of inertia of the area about the  $zz$  axis which is perpendicular to  $xx$  and  $yy$  and passing through the point of intersection of  $xx$  and  $yy$  is given by

$$I_{zz} = I_{xx} + I_{yy}$$

### Proof:

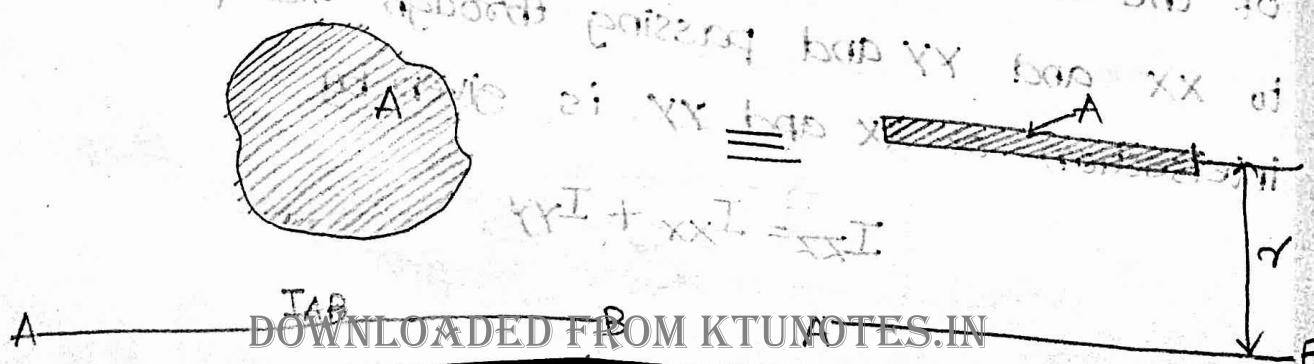

consider a small elemental area,  $dA$  at a distance  $r'$  from origin.

### POLAR MOMENT OF INERTIA

Moment of inertia about  $zz$  axis which is perpendicular to  $xx$  and  $yy$  and passing through the point of intersection of  $xx$  and  $yy$  is called polar moment of inertia.

### RADIUS OF GYRATION:

$$I_{AB} = Ar^2$$

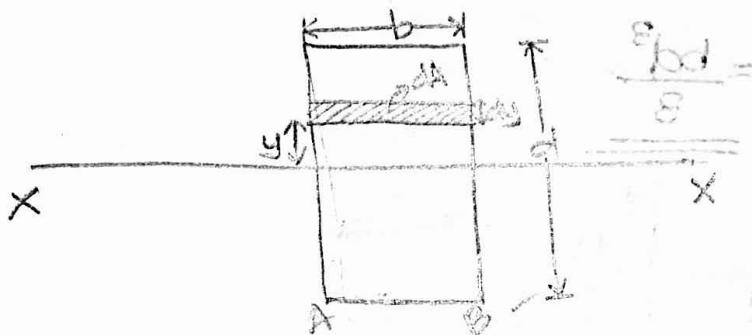

$$dA + dI = gI^2$$

where,  $r$  is called the radius of gyration.

## MOMENT OF INERTIA OF REGULAR FIGURES

### 1. Rectangle

Consider a rectangle of dimensions ' $b$ ' and ' $d$ '.

Consider a rectangular strip of thickness ' $dy$ ' at a distance ' $y$ ' from centroidal axis.

$$dA = bdy$$

$$I_{xx} = \int y^2 dA$$

$$\text{Area moment of inertia} = \int y^2 bd़y$$

$$= b \int_{-d/2}^{d/2} y^2 dy$$

$$= b \left[ \frac{y^3}{3} \right]_{-d/2}^{d/2}$$

$$= b \left[ \frac{d^3}{24} + \frac{d^3}{24} \right]$$

$$= \frac{bd^3}{12}$$

$$\frac{bd^3}{12}$$

$$= \frac{bd^3}{12}$$

$$I_{AB} = I_G + Ab^2$$

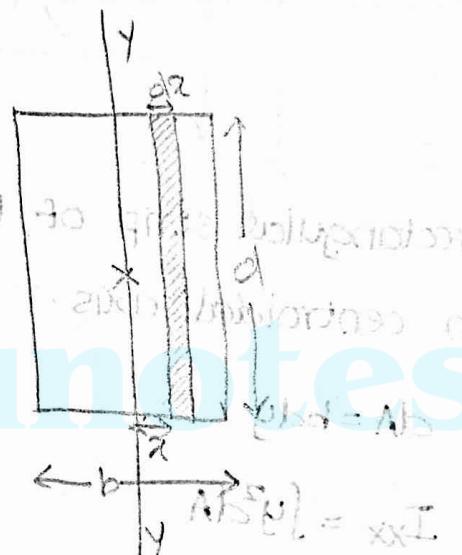

$$I_G = \frac{\pi d^4}{32}$$

$$I_{AB} = \frac{bd^3}{12} + (bd) \left(\frac{d}{2}\right)^2$$

$$= \frac{bd^3}{12} + \frac{bd^3}{4}$$

$\therefore b \text{ bar 'd' } = \frac{4bd^3}{12}$

$$= \frac{bd^3}{3}$$

Consider a vertical strip of thickness  $dx$  at a distance  $x$  from centroidal axis.

$$dA = d \cdot dx$$

$$I_{xy} = \int x^2 dA$$

$$= \int x^2 dA \cdot dx$$

$$= d \int_{-b/2}^{b/2} x^2 dx$$

$$= d \left[ \frac{x^3}{3} \right]_{-b/2}^{b/2}$$

$$= \frac{db^3}{12}$$

$$I_{AB} = I_G + Ab^2$$

$$= \frac{ab^3}{12} + bd \left(\frac{b}{2}\right)^2$$

• मुख्य अंकित करने की विधि का अध्ययन करते हैं। इसमें दो भौतिकीय परिपथों का उल्लेख है।

$$= \frac{ab^3}{12} + \frac{ab^3}{4}$$

$= \frac{4bd^3}{12}$  परिपथ का गणना करने की विधि

$$= \frac{bd^3}{3}$$

## MOMENT OF INERTIA

(b) Moment of Inertia of a Triangle.

$I_G$  following parallel axis theorem

$$dI_A + dI_E = dI_T$$

consider an element of thickness  $dy$  at a distance  $y$  from the vertex R.

$$\text{Area of element, } dA = bdy$$

$$I_R = \int y^2 dA$$

$$I_R = \int_0^H y^2 bdy$$

$$\frac{b}{B} = \frac{y}{H}$$

$$\text{From fig. } b = \frac{B}{H} \times y$$

$$b = A/y$$

$$I_R = \int_0^H y^2 \times \frac{B}{H} y dy$$

$$= \frac{B}{H} \left[ \frac{y^4}{4} \right]_0^H$$

$$= \frac{B}{H} \left( \frac{H^4}{4} \right)$$

$$I_R = \frac{BH^3}{4}$$

Using parallel axis theorem,

$$I_R = I_G + Ah^2$$

$$I_G = I_R - Ah^2$$

$$= \frac{BH^3}{4} - \frac{1}{2} BH \left(\frac{2}{3}H\right)^2$$

$$I_G = \frac{BH^3}{36}$$

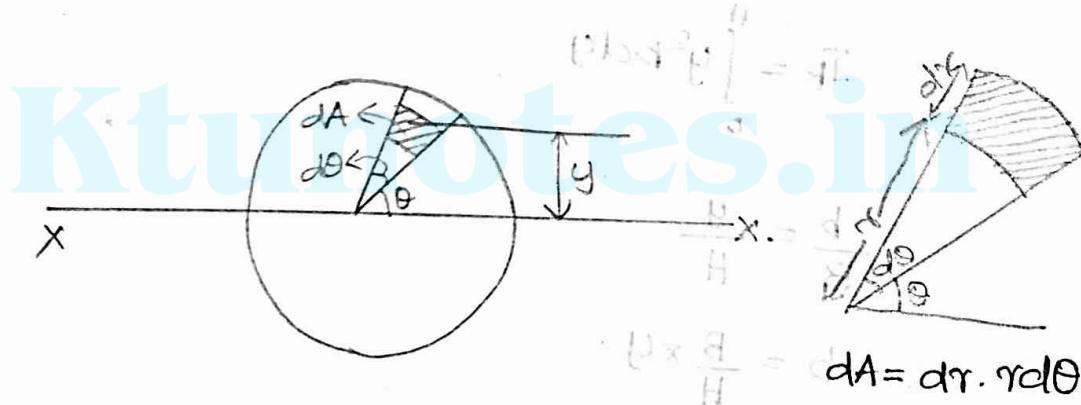

Again using parallel axis theorem,

$$I_{PQ} = I_G + Ab^2$$

$$= \frac{BH^3}{36} + \frac{1}{2} \times B \times H \times \left(\frac{H}{3}\right)^2$$

$$I_{PQ} = \frac{BH^3}{12}$$

(c) Moment of Inertia of a Circular Lamina About an Axis Passing Through Centroid.

$$I_{xx} = \int y^2 dA$$

$$= \int_0^R \int_0^{2\pi} (r \sin \theta)^2 r dr d\theta$$

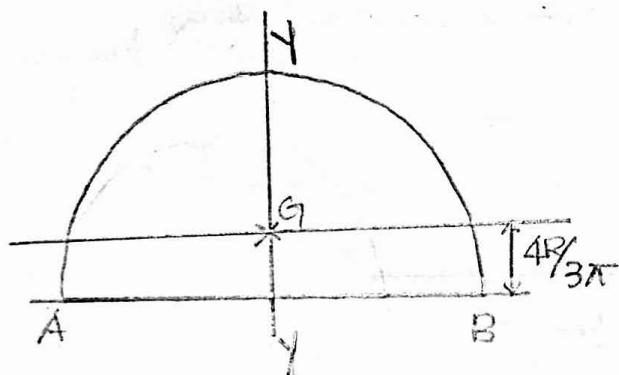

$$= \int_0^R \int_0^{2\pi} r^3 \sin^2 \theta dr d\theta$$

$$= \frac{R^4}{8} \left[ \theta - \frac{\sin 2\theta}{2} \right]_0^{2\pi} = \frac{\pi R^4}{4}$$

$$I_{xx} = \frac{\pi R^4}{4} = \frac{\pi D^4}{64}$$

$$I_{xx} = I_{yy} = \frac{\pi D^4}{64}$$

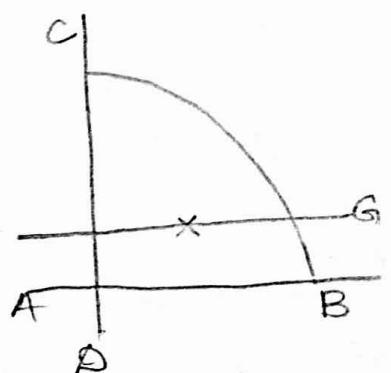

(d) Moment of Inertia of Semicircle

$$I_{AB} = \frac{\pi D^4}{128} = I_{yy}$$

$$\begin{aligned} I_{GG} &= I_{AB} - Ab^2 \\ &= I_{AB} - A \left(\frac{4R}{3\pi}\right)^2 \\ &= 0.11 R^4 \end{aligned}$$

(e) Moment of inertia of quadrant of a Circle

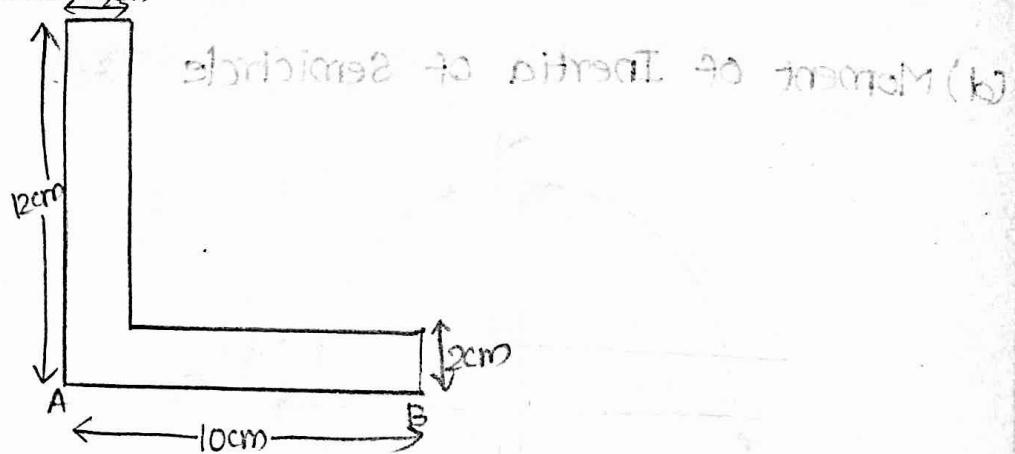

$$I_{AB} = \frac{\pi D^4}{256} = I_{CD}$$

$$I_{GG} = 0.055 R^4$$

$$(I_{xx} + I_{yy}) + (I_{xx} + I_{yy}) = 2(I_{xx} + I_{yy})$$

Q: Find the moment of inertia of the area about its centroidal axis

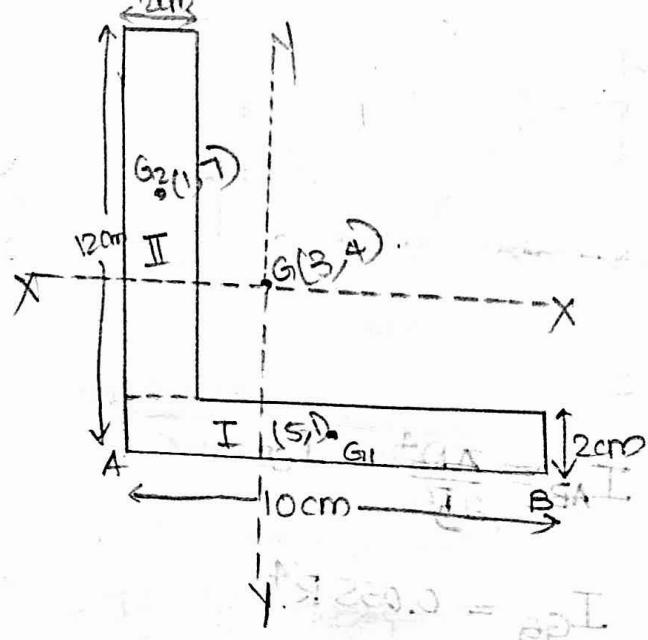

$$A_1 = 20 \text{ cm}^2 \quad x_1 = 5 \text{ cm} \quad y_1 = 1 \text{ cm}$$

$$A_2 = 20 \text{ cm}^2 \quad x_2 = 1 \text{ cm} \quad y_2 = 7 \text{ cm}$$

$$\bar{x} = \frac{A_1 x_1 + A_2 x_2}{A_1 + A_2} = \frac{10 \times 2 \times 5 + 10 \times 2 \times 1}{40} = 3 \text{ cm}$$

$$\text{Solving } \bar{y} = \frac{A_1 y_1 + A_2 y_2}{A_1 + A_2} = \frac{20 \times 1 + 20 \times 7}{40} = 4 \text{ cm}$$

$$\begin{aligned} I_{xx} &= I_{xx1} + I_{xx2} \\ &= (I_{GG_1} + A_1 b_1^2) + (I_{GG_2} + A_2 b_2^2) \end{aligned}$$

$$= \left( \frac{10 \times 2^3}{12} + 20 \times 3^2 \right) + \left( \frac{10 \times 2^3}{12} + 20 \times 3^2 \right)$$

$$= 186.67 + 346.67$$

$$= \underline{\underline{533.34 \text{ cm}^4}}$$

$$I_{yy} = I_{yy1} + I_{yy2}$$

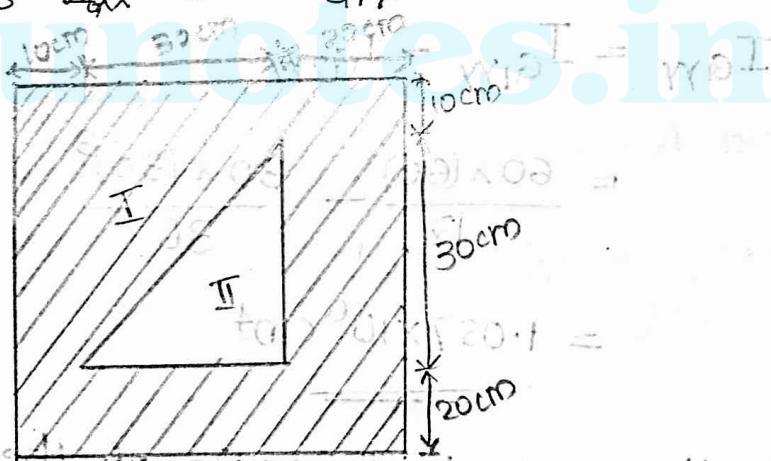

$$= (I_{GG1} + A_1 b_1^2) + (I_{GG2} + A_2 b_2^2)$$

$$= \left( \frac{10 \times 2^3}{12} + 20 \times 2^2 \right) + \left( \frac{2 \times 10^3}{12} + 20 \times 2^2 \right)$$

$$=$$

$$\frac{(0.2) \times 0.8}{28} - \frac{(0.2) \times 0.6}{61} =$$

a: calculate the moment of inertia of shaded area about centroidal axes  $I_{xx}$  and  $I_{yy}$ .

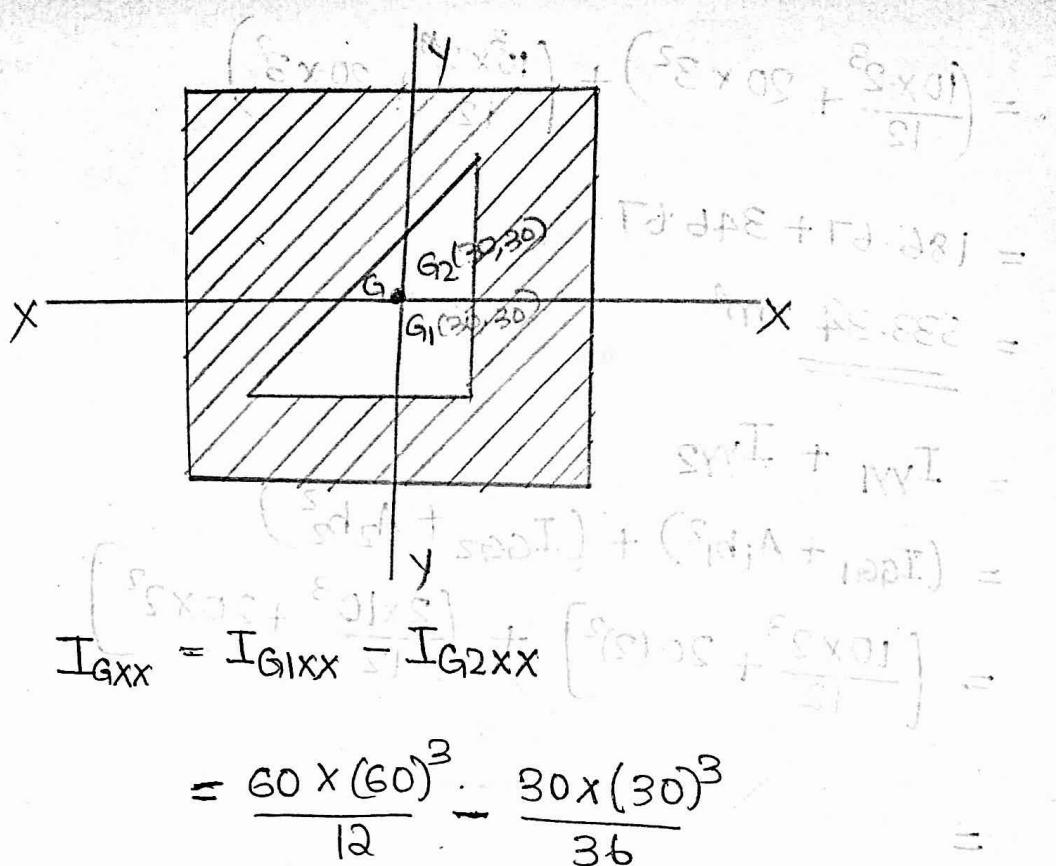

$$A_1 = 3600 \text{ cm}^2 \quad x_1 = 30 \text{ cm} \quad y_1 = 30 \text{ cm}$$

$$A_2 = 450 \text{ cm}^2 \quad x_2 = 30 \text{ cm} \quad y_2 = 30 \text{ cm}$$

$$\bar{x} = \frac{A_1 x_1 - A_2 x_2}{A_1 - A_2} = \frac{3600 \times 30 - 450 \times 30}{3600 - 450} = 30$$

$$\bar{y} = \frac{A_1 y_1 - A_2 y_2}{A_1 - A_2} = \frac{3600 \times 30 - 450 \times 30}{3600 - 450} = 30$$

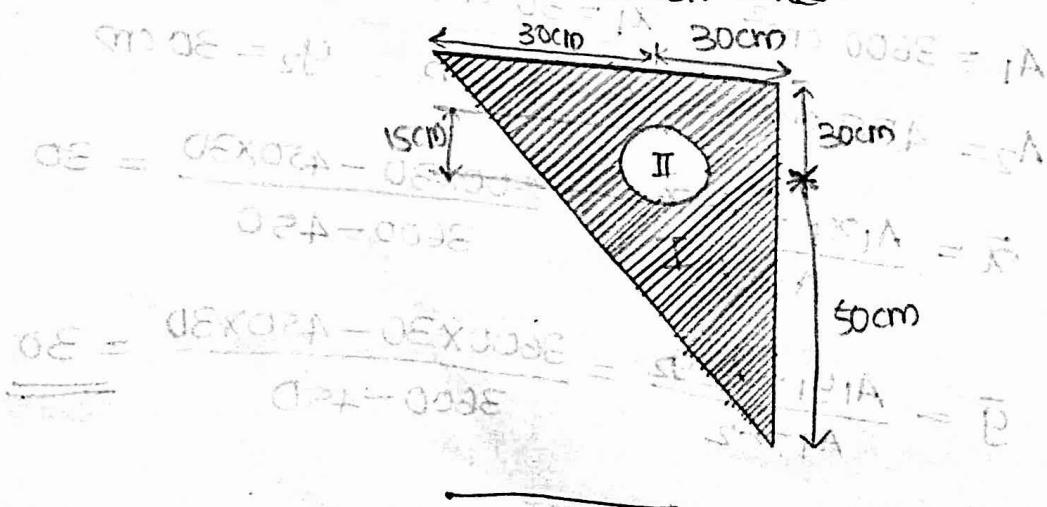

$$I_{GYY} = I_{G_1YY} - I_{G_2YY}$$

$$= \frac{60 \times (60)^3}{12} - \frac{30 \times (30)^3}{36}$$

$$= 1.057 \times 10^6 \text{ cm}^4$$

17/10/2019

Q: Calculate the moment of inertia of the shaded area, with respect to the centroidal axes.

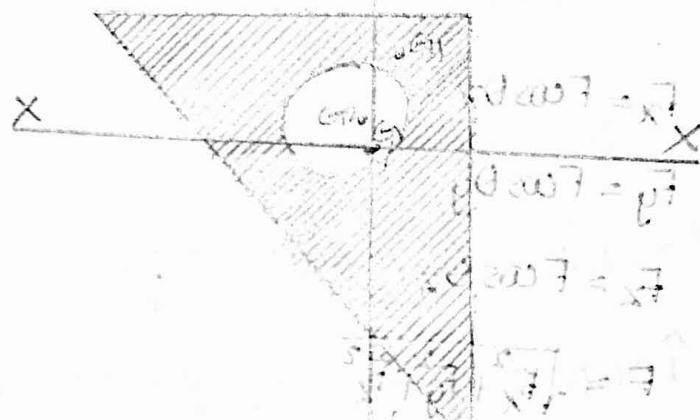

$$A_1 = \frac{1}{2} \times 60 \times 80 = 2400 \text{ cm}^2 \quad x_1 = 40 \text{ cm} \quad y_1 = \frac{2 \times 80}{3} = 53.33 \text{ cm}$$

$$A_2 = \pi \left(\frac{15}{2}\right)^2 = 176.715 \text{ cm}^2 \quad x_2 = 30 \text{ cm} \quad y_2 = 50 \text{ cm}$$

$$\bar{x} = \frac{A_1 x_1 - A_2 x_2}{A_1 - A_2} = \frac{2400 \times 40 - 176.715 \times 30}{2400 - 176.715} = 40.79 \text{ cm}$$

$$\bar{y} = \frac{A_1 y_1 - A_2 y_2}{A_1 - A_2} = \frac{2400 \times 53.33 - 176.715 \times 50}{2400 - 176.715} = 53.598 \text{ cm}$$

~~dia paral axis~~

$$I_{Gxx} = (I_{Gxx1} + A_1 b_1^2) - (I_{Gxx2} + A_2 b_2^2)$$

~~sub to get~~

$$\text{Direct form} = \left( \frac{60 \times 80^3}{36} + \frac{1}{2} \times 60 \times 80 \times (0.265)^2 \right) - \left[ \frac{\pi \times 15^4}{64} + \pi \times \left(\frac{15}{2}\right)^2 (3.598)^2 \right]$$

$$= 853333.333 + 168.54 - 2485.049 - 2287.677$$

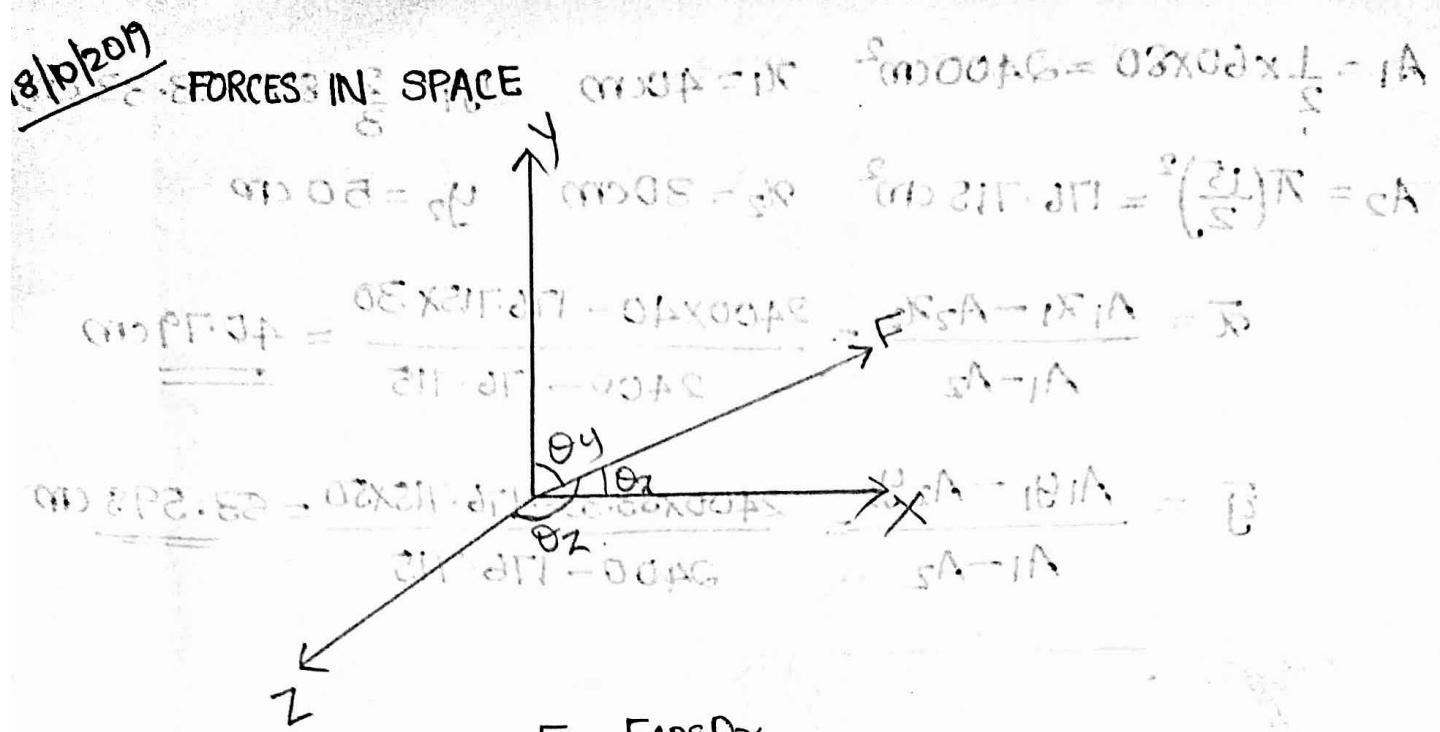

$$= 848729.147 \text{ cm}^4$$

$$I_{Gy} = (I_{Gyy1} + A_1 b_1^2) - (I_{Gyy2} + A_2 b_2^2)$$

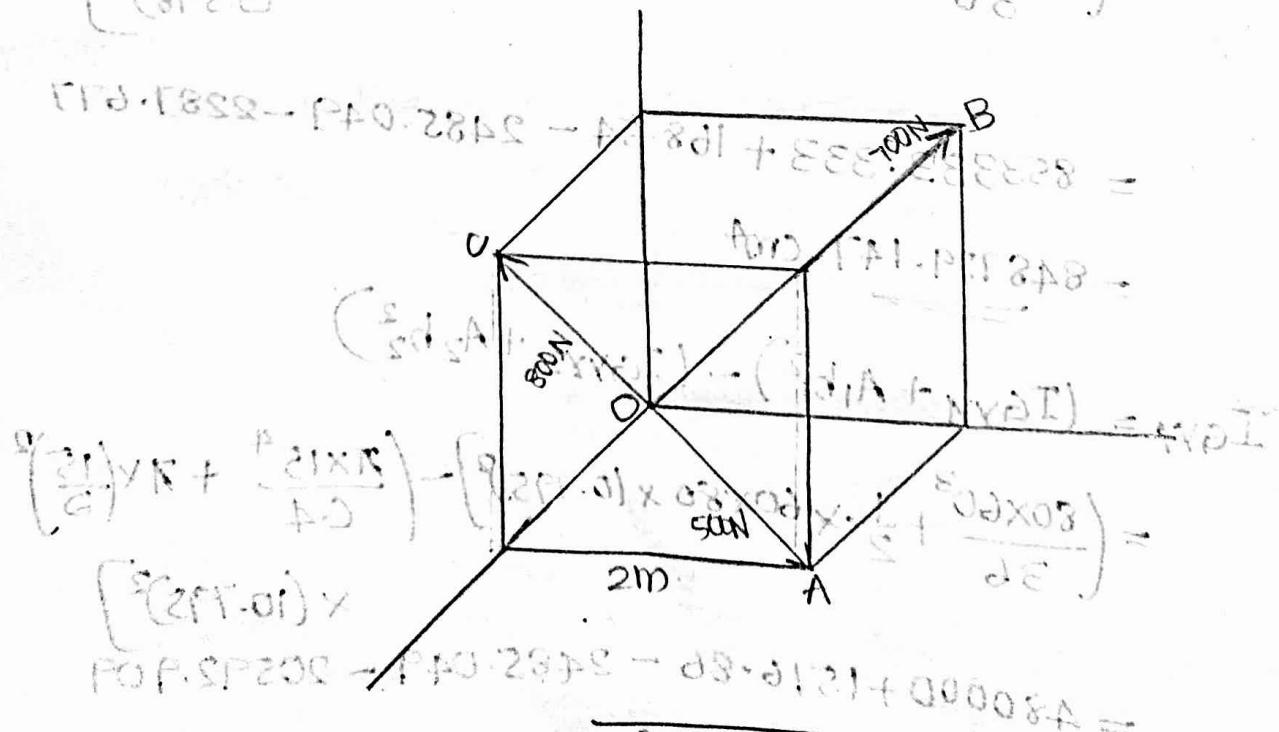

$$= \left( \frac{80 \times 60^3}{36} + \frac{1}{2} \times 60 \times 80 \times (0.795)^2 \right) - \left[ \frac{\pi \times 15^4}{64} + \pi \times \left(\frac{15}{2}\right)^2 \times (10.795)^2 \right]$$

$$= 480000 + 1516.86 - 2485.049 - 20592.909$$

$$= 458438.902 \text{ cm}^4$$

Q: Three forces 500N, 700N and 800N are acting along with three diagonals of adjacent faces of a cube of side 2m as shown in figure. Find the resultant force.

Given  $O(0,0,0)$ ,  $A(2,0,2)$ ,  $B(2,2,0)$  &  $C(0,2,2)$

$$\text{Unit vector along } OA = \frac{(x_A - x_0)\hat{i} + (y_A - y_0)\hat{j} + (z_A - z_0)\hat{k}}{\sqrt{(x_A - x_0)^2 + (y_A - y_0)^2 + (z_A - z_0)^2}}$$

$$= \frac{2\hat{i} + 2\hat{k}}{\sqrt{4+4}}$$

$$= \frac{1}{\sqrt{2}}\hat{i} + \frac{1}{\sqrt{2}}\hat{k}$$

$$F_{OA} = 500 \left[ \frac{1}{\sqrt{2}}\hat{i} + 0\hat{j} + \frac{1}{\sqrt{2}}\hat{k} \right] = 353.55\hat{i} + 0\hat{j} + 353.55\hat{k}$$

$$F_{OB} = 700 \left[ \frac{2\hat{i} + 2\hat{j} + 0\hat{k}}{2\sqrt{2}} \right] = 495\hat{i} + 495\hat{j} + 0\hat{k}$$

$$F_{OC} = 800 \left[ \frac{0\hat{i} + 2\hat{j} + 2\hat{k}}{2\sqrt{2}} \right] = 0\hat{i} + 565.69\hat{j} + 565.69\hat{k}$$

$$R = F_{OA} + F_{OB} + F_{OC}$$

$$R = 848\hat{i} + 1060\hat{j} + 919\hat{k}$$

$$R = \sqrt{(848)^2 + (1060)^2 + (919)^2} = 1639.29 \text{ N}$$

$$F_x = 848 \text{ N}$$

$$F_y = 1060 \text{ N}$$

$$F_z = 919 \text{ N}$$

$$\theta_x = \cos^{-1}\left(\frac{F_x}{F}\right) = \frac{58.85^\circ}{\cancel{1639.29}}$$

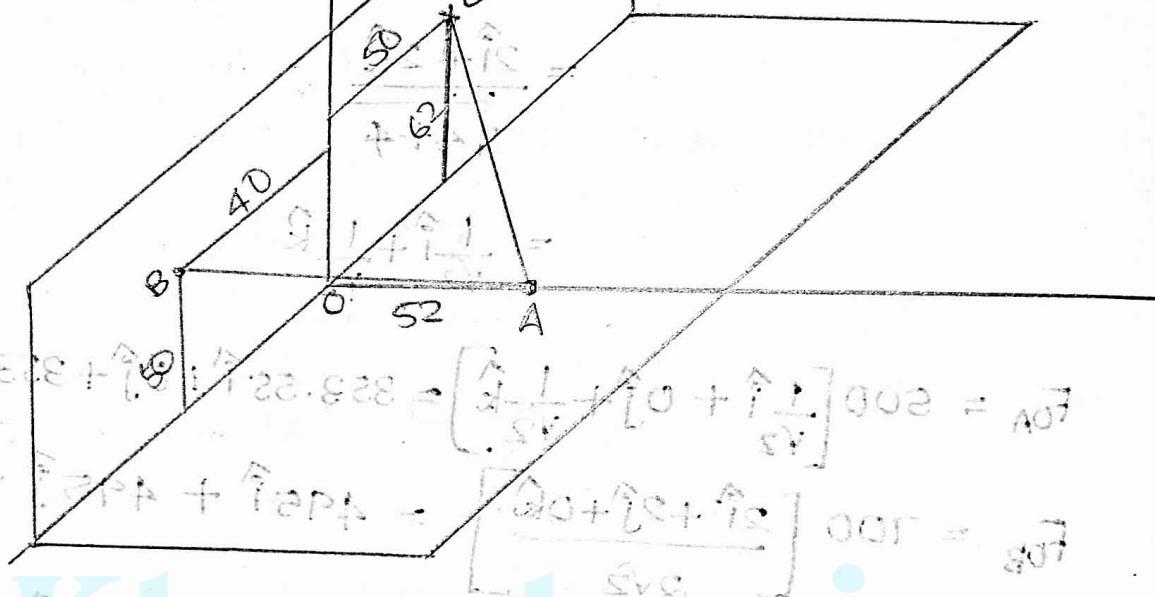

$$\theta_y = \cos^{-1}\left(\frac{F_y}{F}\right) = \frac{49.71^\circ}{\cancel{1639.29}}$$

$$\theta_z = \cos^{-1}\left(\frac{F_z}{F}\right) = \frac{55.902^\circ}{\cancel{1639.29}}$$

Q: Two cables AB and AC are attached at A as shown in figure. Determine the resultant of forces exerted at A by the two cables, if tension in AB is 2000 N and AC is 1500 N.

$$\sqrt{(0x - 52)^2 + (0y - 40)^2 + (0z - 0)^2} = \text{AO path taken} \rightarrow 52$$

$$\sqrt{(0x - 52)^2 + (0y - 62)^2 + (0z - 50)^2} = \text{AC path taken} \rightarrow 78.49$$

$$T_{AB} = 2000 \text{ N}$$

$$T_{AC} = 1500 \text{ N}$$

$$A(52, 0, 0)$$

$$B(0, 50, 40)$$

$$C(0, 62, -50)$$

$$F_{AB} = 2000 \left[ \frac{-52\hat{i} + 50\hat{j} + 40\hat{k}}{\sqrt{52^2 + 50^2 + 40^2}} \right] = 2000 \left[ \frac{-52\hat{i} + 50\hat{j} + 40\hat{k}}{82.49} \right] = 240.20\hat{i} + 240.19\hat{j} + 96.91\hat{k}$$

$$= -1260.76\hat{i} + 1212.27\hat{j} + 969.81\hat{k}$$

$$F_{AC} = 1500 \left[ \frac{-52\hat{i} + 62\hat{j} - 50\hat{k}}{\sqrt{52^2 + 62^2 + 50^2}} \right] = 1500 \left[ \frac{-52\hat{i} + 62\hat{j} - 50\hat{k}}{95.12} \right] = -820.02\hat{i} + 977.71\hat{j} - 788.48\hat{k}$$

$$R = F_{AB} + F_{AC} = -2080.78 \hat{i} + 2189.98 \hat{j} + 181.33 \hat{k}$$

$$R = \sqrt{F_{AB}^2 + F_{AC}^2} = 3026.31 \text{ N}$$

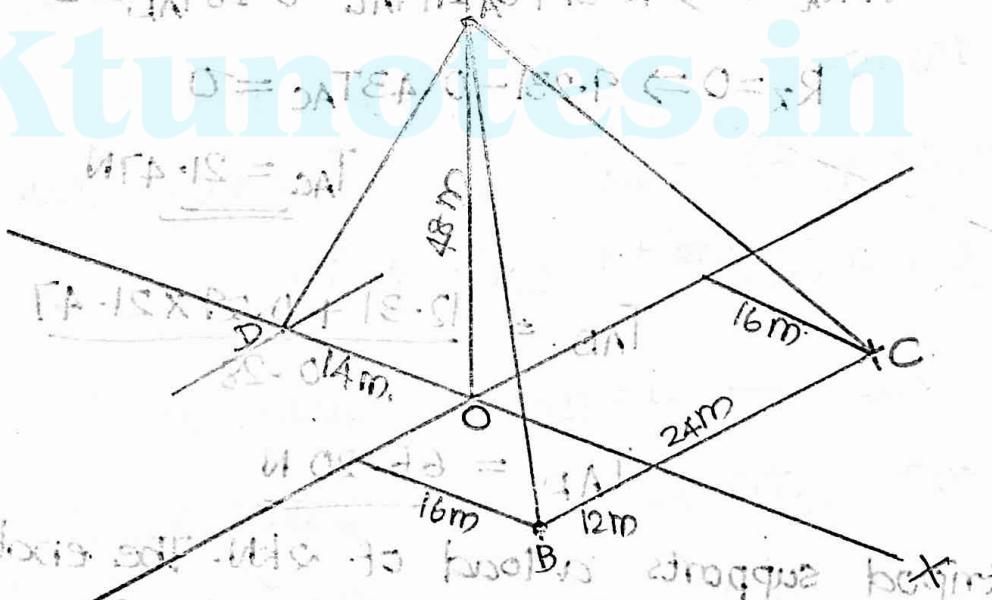

$$\theta_x = \cos^{-1}\left(\frac{R_x}{R}\right) = 133.44^\circ$$

$$\theta_y = \cos^{-1}\left(\frac{R_y}{R}\right) = 43.64^\circ$$

$$\theta_z = \cos^{-1}\left(\frac{R_z}{R}\right) = 86.56^\circ$$

~~Q: A post is held in vertical position by three cables AB, AC and AD. If tension in cable AB is 40N, calculate the required tension in AC and AD so that the resultant of the three forces applied at A is vertical.~~

~~$O = OA + OB + OC = R$~~

~~A block of mass 10kg is dropped from a height of 10m onto a horizontal surface. It comes to rest after traveling 2m. Calculate the average force exerted by the surface on the block.~~

$$A(0, 48, 0)$$

$$B(16, 0, 12)$$

$$C(16, 0, -24)$$

$$D(-14, 0, 0)$$

$$F_{AB} = 40 \left( \frac{16\hat{i} - 48\hat{j} + 12\hat{k}}{52} \right) = 12.31\hat{i} - 36.92\hat{j} + 9.23\hat{k}$$

$$F_{AC} = T_{AC} \left( \frac{16\hat{i} - 48\hat{j} - 24\hat{k}}{56} \right) = 0.29T_{AC}\hat{i} - 0.86T_{AC}\hat{j} - 0.43T_{AC}\hat{k}$$

$$F_{AD} = T_{AD} \left( \frac{-14\hat{i} - 48\hat{j} + 0\hat{k}}{50} \right) = -0.28T_{AD}\hat{i} - 0.96T_{AD}\hat{j} + 0\hat{k}$$

$$R = F_{AB} + F_{AC} + F_{AD}$$

$$R_x\hat{i} + R_y\hat{j} + R_z\hat{k} = (12.31 + 0.29T_{AC} - 0.28T_{AD})\hat{i} - (36.92 + 0.43T_{AC} + 0.96T_{AD})\hat{j} + (9.23 - 0.43T_{AC})\hat{k}$$

Given,  $R$  is vertical.

$$\therefore R_x = 0 \Rightarrow 12.31 + 0.29T_{AC} - 0.28T_{AD} = 0$$

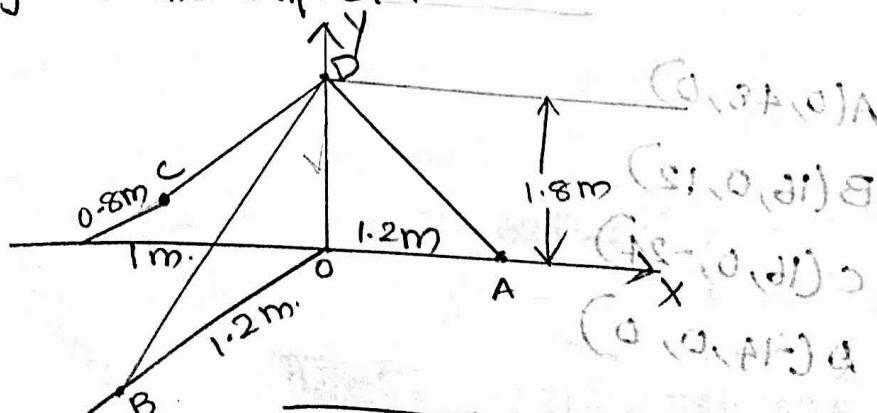

$$R_z = 0 \Rightarrow 9.23 - 0.43T_{AC} = 0$$

$$\underline{T_{AC} = 21.47\text{N}}$$

$$T_{AD} = \frac{12.31 + 0.29 \times 21.47}{0.28}$$

$$\underline{T_{AD} = 66.20\text{ N}}$$

Q: A tripod supports a load of 2kN. The ends A, B and C are in the x-z plane. Find the force in the three legs of the tripod.

$$\underline{F_{OC}} = \underline{-20.04\hat{i} - 13.36\hat{j} + 6.68\hat{k}}$$

Unit vector along  $\vec{OD} = \frac{5\hat{i} + \hat{j} - 20\hat{k}}{\sqrt{25+1+400}}$

$$F_{OD} = \left( \frac{5\hat{i} + \hat{j} - 20\hat{k}}{\sqrt{426}} \right) 40$$

$$\underline{F_{OD}} = \underline{9.69\hat{i} + 1.8\hat{j} - 38.76\hat{k}}$$

$$F = F_{OA} + F_{OB} + F_{OC} + F_{OD}$$

$$= 10.95\hat{i} - 12.83\hat{j} + 10.94\hat{k}$$

$$\underline{R} = \underline{10.95\hat{i} - 12.83\hat{j} + 10.94\hat{k}}$$

$$R = \sqrt{(10.95)^2 + (12.83)^2 + (10.94)^2}$$

$$= 20.105 \text{ kN}$$

$$\cos \theta_x = \frac{Rx}{R}$$

$$\theta_x = \cos^{-1} \left( \frac{Rx}{R} \right) = 57^\circ$$

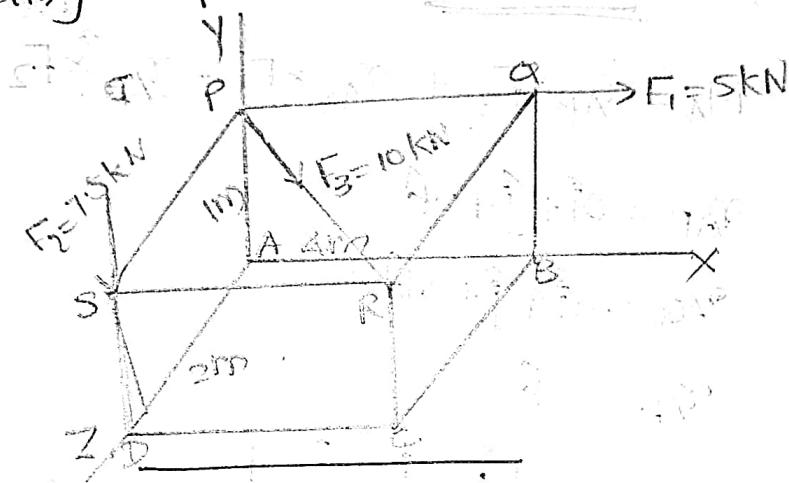

$$\theta_y = \cos^{-1} \left( \frac{Ry}{R} \right) = 129.65^\circ$$

$$\theta_z = \cos^{-1} \left( \frac{Rz}{R} \right) = 57.03^\circ$$

$$\theta_x = \frac{\theta_x + \theta_z - \theta_A}{2\pi} = 87^\circ$$

$$\underline{F_{PA}} + \underline{f_{DP.2}} - \underline{F_{EP.11}}$$

Q: A rectangular box is subjected to three forces as shown in figure. Reduce them to an equivalent force-couple system acting at point A. (14.08.14)

$$P(0,1,0) \quad Q(4,1,0) \quad S(0,1,2) \quad R(4,1,2) \quad A(0,0,2)$$

Unit vector along  $PQ = \frac{4\hat{i} + 0\hat{j} + 0\hat{k}}{\sqrt{4^2}} = \hat{i}$

$$F_{PQ} = F_1 = \hat{i}(5) = \underline{\underline{5\hat{i}}}$$

Unit vector along  $PR = \frac{4\hat{i} + 0\hat{j} + 2\hat{k}}{\sqrt{16+4}} = \frac{4\hat{i} + 2\hat{k}}{\sqrt{20}}$

$$F_{PR} = F_3 = \left(\frac{4\hat{i} + 2\hat{k}}{\sqrt{20}}\right)10$$

$$= 8.944\hat{i} + 0\hat{j} + 4.472\hat{k}$$

Unit vector along  $SP = \frac{0\hat{i} - \hat{j} + 0\hat{k}}{\sqrt{1^2}} = -\hat{j}$

$$F_{SP} = F_2 = (-\hat{j})7.5$$

unit vector along  $SP = -\hat{j}$  and perpendicular to the plane of forces

$$\vec{R} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 \text{ in } \text{N} \text{ and m}$$

$$= 13.944\hat{i} - 7.5\hat{j} + 4.472\hat{k}$$

$$R = \sqrt{(13.944)^2 + (7.5)^2 + (4.472)^2}$$

$$= 16.452 \text{ kN}$$

$$M_A = \gamma_{AP} \times F_3 + \gamma_{AQ} \times F_1 + \gamma_{AD} \times F_2$$

$$\gamma_{AP} = 0\hat{i} + \hat{j} + 0\hat{k}$$

$$\gamma_{AQ} = 4\hat{i} + \hat{j} + 0\hat{k}$$

$$\gamma_{AD} = 2\hat{k}$$

$$\gamma_{AP} \times F_3 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 0 & 1 & 0 \\ 8.944 & 0 & 4.472 \end{vmatrix} = 4.472\hat{i} - 0\hat{j} - 8.944\hat{k}$$

$$\gamma_{AQ} \times F_1 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 4 & 1 & 0 \\ 5 & 0 & 0 \end{vmatrix} = 0\hat{i} + 0\hat{j} - 5\hat{k}$$

$$\gamma_{AD} \times F_2 = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 0 & 0 & 2 \\ 0 & -7.5 & 0 \end{vmatrix} = -15\hat{i}$$

$$\therefore M_A = -10.528\hat{i} + 0\hat{j} - 13.944\hat{k}$$

### MASS MOMENT OF INERTIA

Mass is the quantitative measure of the resistance to change the motion of a body. Inertia of a body is the property by virtue of which it resists any change in its state of rest or of uniform motion. Translatory inertia is defined as mass and rotational inertia is known as moment of inertia.

Mass moment of inertia of a ring of radius R.

Let A be the cross sectional area of a ring, and

$\rho$  be the mass density of ring material. Consider an

elemental length  $cdl$ .

Volume of the ring of this elemental length =  $Axdl$ .

Mass of the elemental volume =  $\rho \times A \times dl$ .

$$I_{zz} = \int_0^{2\pi R} \rho A dl \times R^2$$

$$= R^2 \rho A [l]_0^{2\pi R}$$

$$= R^2 \rho A X 2\pi R$$

$$= R^2 2\pi R A \rho$$

$$I_{zz} = M R^2$$

$$I_{zz} = I_{xx} + I_{yy}$$

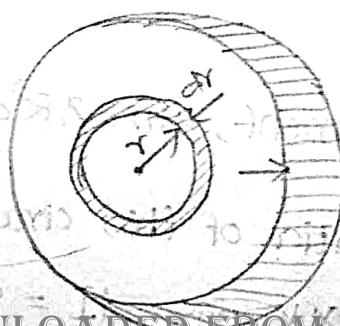

Because of symmetry,  $I_{xx} = I_{yy}$

$$I_{zz} = I_{xx} + I_{yy} = 2I_{xx}$$

$$\boxed{I_{xx} = I_{yy} = \frac{MR^2}{2}}$$

Mass moment of inertia of disc

Consider an elemental ring of radial thickness  $dr$  at a distance  $r$  from the centre.

Volume of the ring =  $2\pi r dr t \times f$

Mass of elemental ring =  $2\pi r dr t \times f$

Moment of inertia of the plate about the axis

through the centre and perpendicular to the plane of plate is  $\int dm r^2$ .

$$I_{zz} = \int_0^R 2\pi r dr t f r^2$$

$$= 2\pi t f \int_0^R r^3 dr$$

$$= 2\pi t f \left[ \frac{r^4}{4} \right]_0^R$$

$$= \frac{2\pi t f R^4}{4}$$

$$= (\pi R^2 t f) \frac{R^2}{2}$$

$$= \frac{m R^2}{2}$$

Polar moment of inertia,  $I_{zz} = I_{xx} + I_{yy} = \frac{m R^2}{2}$

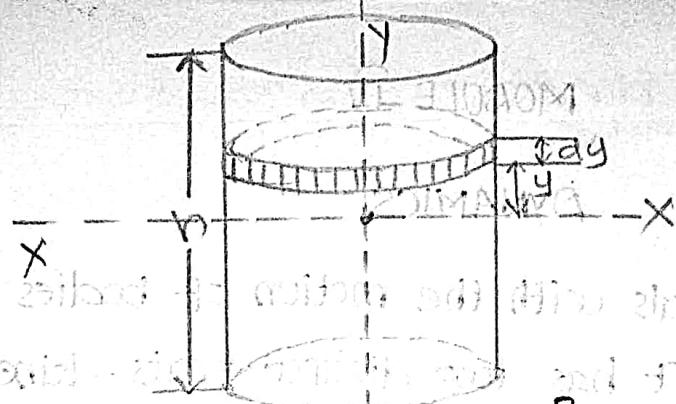

$$I_{xx} = I_{yy} = \frac{I_{zz}}{2} = \frac{m R^2}{4}$$

Mass moment of Inertia of Cylinder

Consider an elemental circular disc of thickness  $dy$  at a distance  $y$  from the centroidal  $XX$  axis of the cylinder.

Mass of the element,  $dm = \pi R^2 dy f$

Moment of inertia of thin circular disc about its centroidal  $XX$  axis,  $dI = \frac{dm R^2}{4}$

$$dI_{xx} = dI + (dm)y^2$$

$$dI_{xx} = \left[ \frac{dmR^2}{4} + dm y^2 \right]$$

$$= \pi R^2 dy \frac{\int R^2}{4} + \pi R^2 dy \int y^2 dy$$

$$I_{xx} = \int_{-h/2}^{h/2} \left( \frac{\pi R^4}{4} y \right) dy + \pi R^2 \int_{-h/2}^{h/2} y^2 dy$$

$$= 2\pi \frac{R^4}{4} \int [y]_0^{h/2} + 2\pi R^2 \int \left[ \frac{y^3}{3} \right]_0^{h/2}$$

$$= \frac{\pi R^4}{2} \frac{\int h}{2} + \frac{2\pi R^2}{3} \int \left[ \frac{h}{2} \right]^3$$

$$= \frac{\pi R^2 h^3}{4} \left( R^2 + \frac{h^2}{3} \right)$$

$$= \frac{M}{4} \left( \frac{3R^2 + h^2}{3} \right)$$

$$= \frac{M}{12} (3R^2 + h^2)$$

$$I_{zz} = I_{xx} = \frac{M}{12} (3R^2 + h^2)$$
